P RY 123 648 wards my tent in single file, with a great deal of importance. The leader advanced with a dignified air, and the Doctor got his bottles ready to receive the specimens which the six men had collected. But his expectations, if he indulged any, of adding new species to his collection, soon vanished, when the man laid upon the table two small lizards, *minus their tails*, which had been broken off in securing them. For their arduous services in the cause of science, the captors of the tailless lizards coolly demanded a shirt apiece.

P RY C22 648 Two old chiefs made their appearance to-day, and at once recognised Mr. Leroux as the person who guided Colonel Cooke and his battalion through here in 1847. Mr. Leroux also recognised one whom they called Blanco, as a chief who commanded the Maricopas twenty-five years ago, when a party of hunters and trappers from New Mexico, among whom was Leroux, had a severe fight with them, and escaped narrowly with their lives. On being reminded of it, the old chief recollected the circumstances, which he related, and which corresponded with the account of Leroux.

P ●RY 133 ●311 648 The valley or bottom-land occupied by the Pimos and Coco-Maricopas extends about fifteen miles along the south side of the Gila, and is from two to four miles in width, nearly the whole being occupied by their villages and cultivated fields. The Pimos occupy the eastern portion. There is no dividing line between them, nor any thing to distinguish the villages of one from the other. The whole of this plain is intersected P RY by irrigating canals from the Gila, by which they [312] are enabled to control the waters, and raise the most luxuriant crops.

most luxuriant crops. At the western end of the valley is a rich tract of grass, where we had our encampment. This is a mile or more from the nearest village of the Coco-Maricopas. On the northern side of the river there is less bottom-land, and the irrigation is more difficult. There are a few cultivated spots here; but it is too much exposed to the attacks of their enemies for either tribe to reside upon it.

The villages consist of groups of from twenty to fifty habitations, surrounded by gardens and cultivated fields, intersected in every direction by acequias, which lead the water from the Gila. Their mode of irrigation is the same as that practised in various parts of Mexico. Their cultivated fields are generally fenced with crooked stakes, wattled with brush, the thorny mezquit predominating; although I noticed large patches of wheat, a long distance from any village, that were not inclosed.

Their houses are built with stakes, poles, corn-shucks, and straw. For the small houses, four upright stakes forked at one end are inserted in the ground. For the larger dwellings nine are used; three on each side, and one in the centre. Across the tops of these, other sticks are laid to support the roof. Next a row of poles is inserted in the ground, a few feet outside the larger upright stakes, bent over towards the centre and fastened to the horizontal beams. These are then united in the centre, forming a slightly rounded top. Smaller poles are now horizontally interlaced with the upright ones, and between them straw, corn-shucks, or rushes are interwoven in large masses, so as to shed the rain and protect them from the intense heat of the
